

The logo for BAX3000, featuring the text 'BAX3000' in a stylized, bold, sans-serif font. The 'BAX' is in a larger, more prominent font than the '3000'. The logo is centered within a white, rounded rectangular shape that is part of a larger orange banner.

IT'S THE CURE FOR WHAT AILS YOUR PRACTICE.

The BAX 3000 uses a combination of science that dates back decades and recent advances in technology that for this time allow the science to be digitized, computerized and automated.

Our science has (3) primary components:

First, the machine performs substance specific stress measurement on the Autonomic Nervous System. There is a known relationship between stress, and the body's ability to conduct electricity. As stress fluctuates, so does impedance, or resistance within the body's electrical circuitry. These measurements are taken by the DCM, which is attached to the patient using clips on the middle finger of each hand. When the start button is pushed, a baseline impedance reading is taken.

Second, the machine exposes the patient to specific potential stress inducing substances to determine what may be influencing the patients health and wellness.

The substance exposure is made possible by the brains ability to interpret and differentiate frequencies, which are used to stimulate the nervous system as a representation of the actual substance. Because the nervous system is capable of identifying the frequency of a substance like an apple it is possible to determine which substances cause autonomic nervous system mediated responses during real world exposures. The DCM transposes the frequencies from a digital format, as they are housed in the software, to a radio frequency. During an assessment, The DCM systematically exposes the patient to each individual substance, one at a time, while simultaneously measuring impedance.

If the impedance reading during any specific substance exposure varies to a degree that is considered statistically significant, the system tags it as a stressor and allows the practitioner to apply it during substance Specific Stress reduction therapy, which is the third Basic function of the BAX 3000.

Substance Specific Stress Reduction Therapy is performed using the Light Conductance Meter, which converts the same frequency to a light format.

Before we go on, I should point out that this entire process is safe, effective and FAST. The frequencies are not capable of causing a true allergic reaction, they can cause a brief spike in stress levels, but no more. In fact, the patient will not feel anything at all. The speed with which the system tests through substances is one of the key features of the BAX 3000. The entire library of about 100,000 substances can be scanned in as few as 8 minutes.

Frequency overview

When considering why BAX 3000 practitioners report such high clinical success rates, the benefits provided by the frequencies looms large. It is because of the frequencies that providers are able to look at patients reactions down to the molecular level. If not for the frequencies, it would be impossible to test anywhere close to the number of substances that the BAX 3000 allows. It really isn't even fair to compare the frequency library housed on the BAX 3000 to the substance assessment list available thru any other therapy, holistic or traditional.

In most cases, other therapies have a couple dozen substances that are testable. Some holistic therapies purport to allow for assessment of a thousand or so substances...In either case, these lists are woefully inadequate. It's no wonder why so many people have never had any relief... the available therapies just aren't equipped to properly assess or treat them.

When first learning about frequencies, most doctors have one question: How do you capture the frequency of a substance?

There are a few methods: We can use an oscilloscope, We can use a device which measures the vibrations of photons before and after bombarding a substance or we can use a mathematical formula to measure the changes in known vibration patterns when in contact with the substance to extract a frequency.

Whatever method is chosen, the value of frequencies as a stimulus in the practice of healthcare is a relatively new concept, but there is already a strong track record of performance that clearly demonstrates their value.

Studies have been performed and published that compare this technology against traditional diagnostic and therapeutic methods. Many doctors are astounded to see just how favorably this relatively new and exciting technology compares with traditional diagnostic and therapeutic tools.

We have a number of clinical studies on file specific to frequency based diagnostics and therapy. Please ask your sales consultant to provide them if you're interested in reading more.

Library composition

The frequencies are housed in a virtual library on the computer. With 100,000 substances, just about everything under the sun is represented. As you can see, the library isn't a list of allergens, or foods, or inhalants... it's a list of ANYTHING that can cause a reaction in the human body including components of the human body itself.

And because we are all different, just about anything can cause a reaction. Remember... we aren't looking for an allergy, or a sensitivity, or any item with a specific label... we are looking for whatever may be a stressor, causing autonomic nervous system mediated responses, for each individual patient.

ANS mediated responses can be the underlying trigger for just about anything that a person would seek professional care for. While we don't recommend any person discontinue traditional care, many doctors are surprised to learn the BAX 3000 can help relieve even musculoskeletal discomfort.

We have mentioned over and over that the BAX 3000 provides you with the highest degree of specificity available, and that just about everything under the sun is in the system. But, what about individual differences? What if a person doesn't react to cats in general, but to his or her cat specifically? How do we handle a situation where a person just reacts to one specific item? While not common, it does happen and we have a solution...just collect samples of the cats hair, or take a vacuum bag, or take a sample of dust...or whatever it is that is triggering a reaction, and send it to us. We will capture the frequency, digitize it and send it back to you.

So, not only is the library huge, but it is also growing. The allergen library is fluid and growing by the day.

Software

The BAX 3000 software was designed for those of us who have no experience using computers. In fact, the whole system was designed for doctors who have no computer experience and no experience with this subset of patients.

There are up to 100,000 substances in the library. Imagine how difficult it would be if you had to try to figure out what to do for each person. It would be virtually impossible to use this, and have time to run your existing practice.

In order to make this as effective for your business as it is for your patients, we organized the 100,000 substances by breaking similar items out into groups, and similar groups into procedures. There are only 4 main procedures, each tested individually.

The 4 procedures can be thought of as a hierarchy with the most potentially difficult substances for the body to fight in the first procedure, and the least difficult substances to fight in the fourth procedure.

Each patient is put through the same process. The first procedure is vital to assess because these substances can be long acting, with a delayed onset of symptoms, leading to an over stressed nervous system. An over stressed nervous system can lead to all kinds of secondary and tertiary issues becoming symptomatic.

By following our system, you have the best possible shot of providing long term relief

The Laser

The L.A.S.E.R. (or light and sound energy relaxation) represents a novel approach to wellness, but one that has been studied and shown to be effective. Not only is it effective, but it's simple... so simple it's beautiful.

Think back to high school science class. Remember Ivan Pavlov? Good old Ivan taught his dogs to salivate at the sound of a bell by presenting food while simultaneously ringing a bell. That same process, the ANS mediated response, can cause all kinds of health issues.

A few slides back, we mentioned that allergies can be developed when the brain associates a substance with a trauma. We also mentioned how allergic reactions can be eliminated if the brain stops associating the substance with the trauma. Well... that is precisely what the BAX 3000 is designed to do.

The Light conductance Meter serves two purposes: First, it applies the substance frequencies that the patient has presented as “stressors”. This exposure comes via the light itself, which acts as a carrier medium. Second, it causes a biological reaction that the human brain considers a positive stimulus.

Light energy is proven to have some very interesting effects on the human body. It increases circulation, stimulates healing and even acts with properties similar to mechanical energy. So, light energy, when shined on certain points on the body, will actually stimulate the brain to release endorphins and enkephalins, the body’s natural sedatives and pain killers. I defy you to find two more positive stimuli for the human brain than pain killers and sedatives!!

So, here is how Substance Specific Stress Reduction works... The patient demonstrates a stress reaction to a substance frequency during assessment. That frequency is then emitted during therapy as a light frequency, embedded in the laser beam itself. The light energy causes the release of endorphins and enkephalins, which is a positive stimulus.

The brain will associate the substance with the positive stimulus... which breaks the old association between the substance and trauma, stopping the stress response. The net result: the autonomic nervous system mediated response is eliminated.

Not all symptoms or conditions are caused by a pavlovian type association, much result from dysfunction induced by substance related stress. In these instances, the endorphins and enkephalins retrain the ANS to not become stressed during real world exposure... the goal... to maintain normal function when exposed to the substance.

Like I said at the beginning of this slide... so easy its beautiful! These concepts at first seem like revelations, but when you have a chance to think about it you realize that this is really just common sense.
